
You Need to Know:
HEART DISEASE

Notes

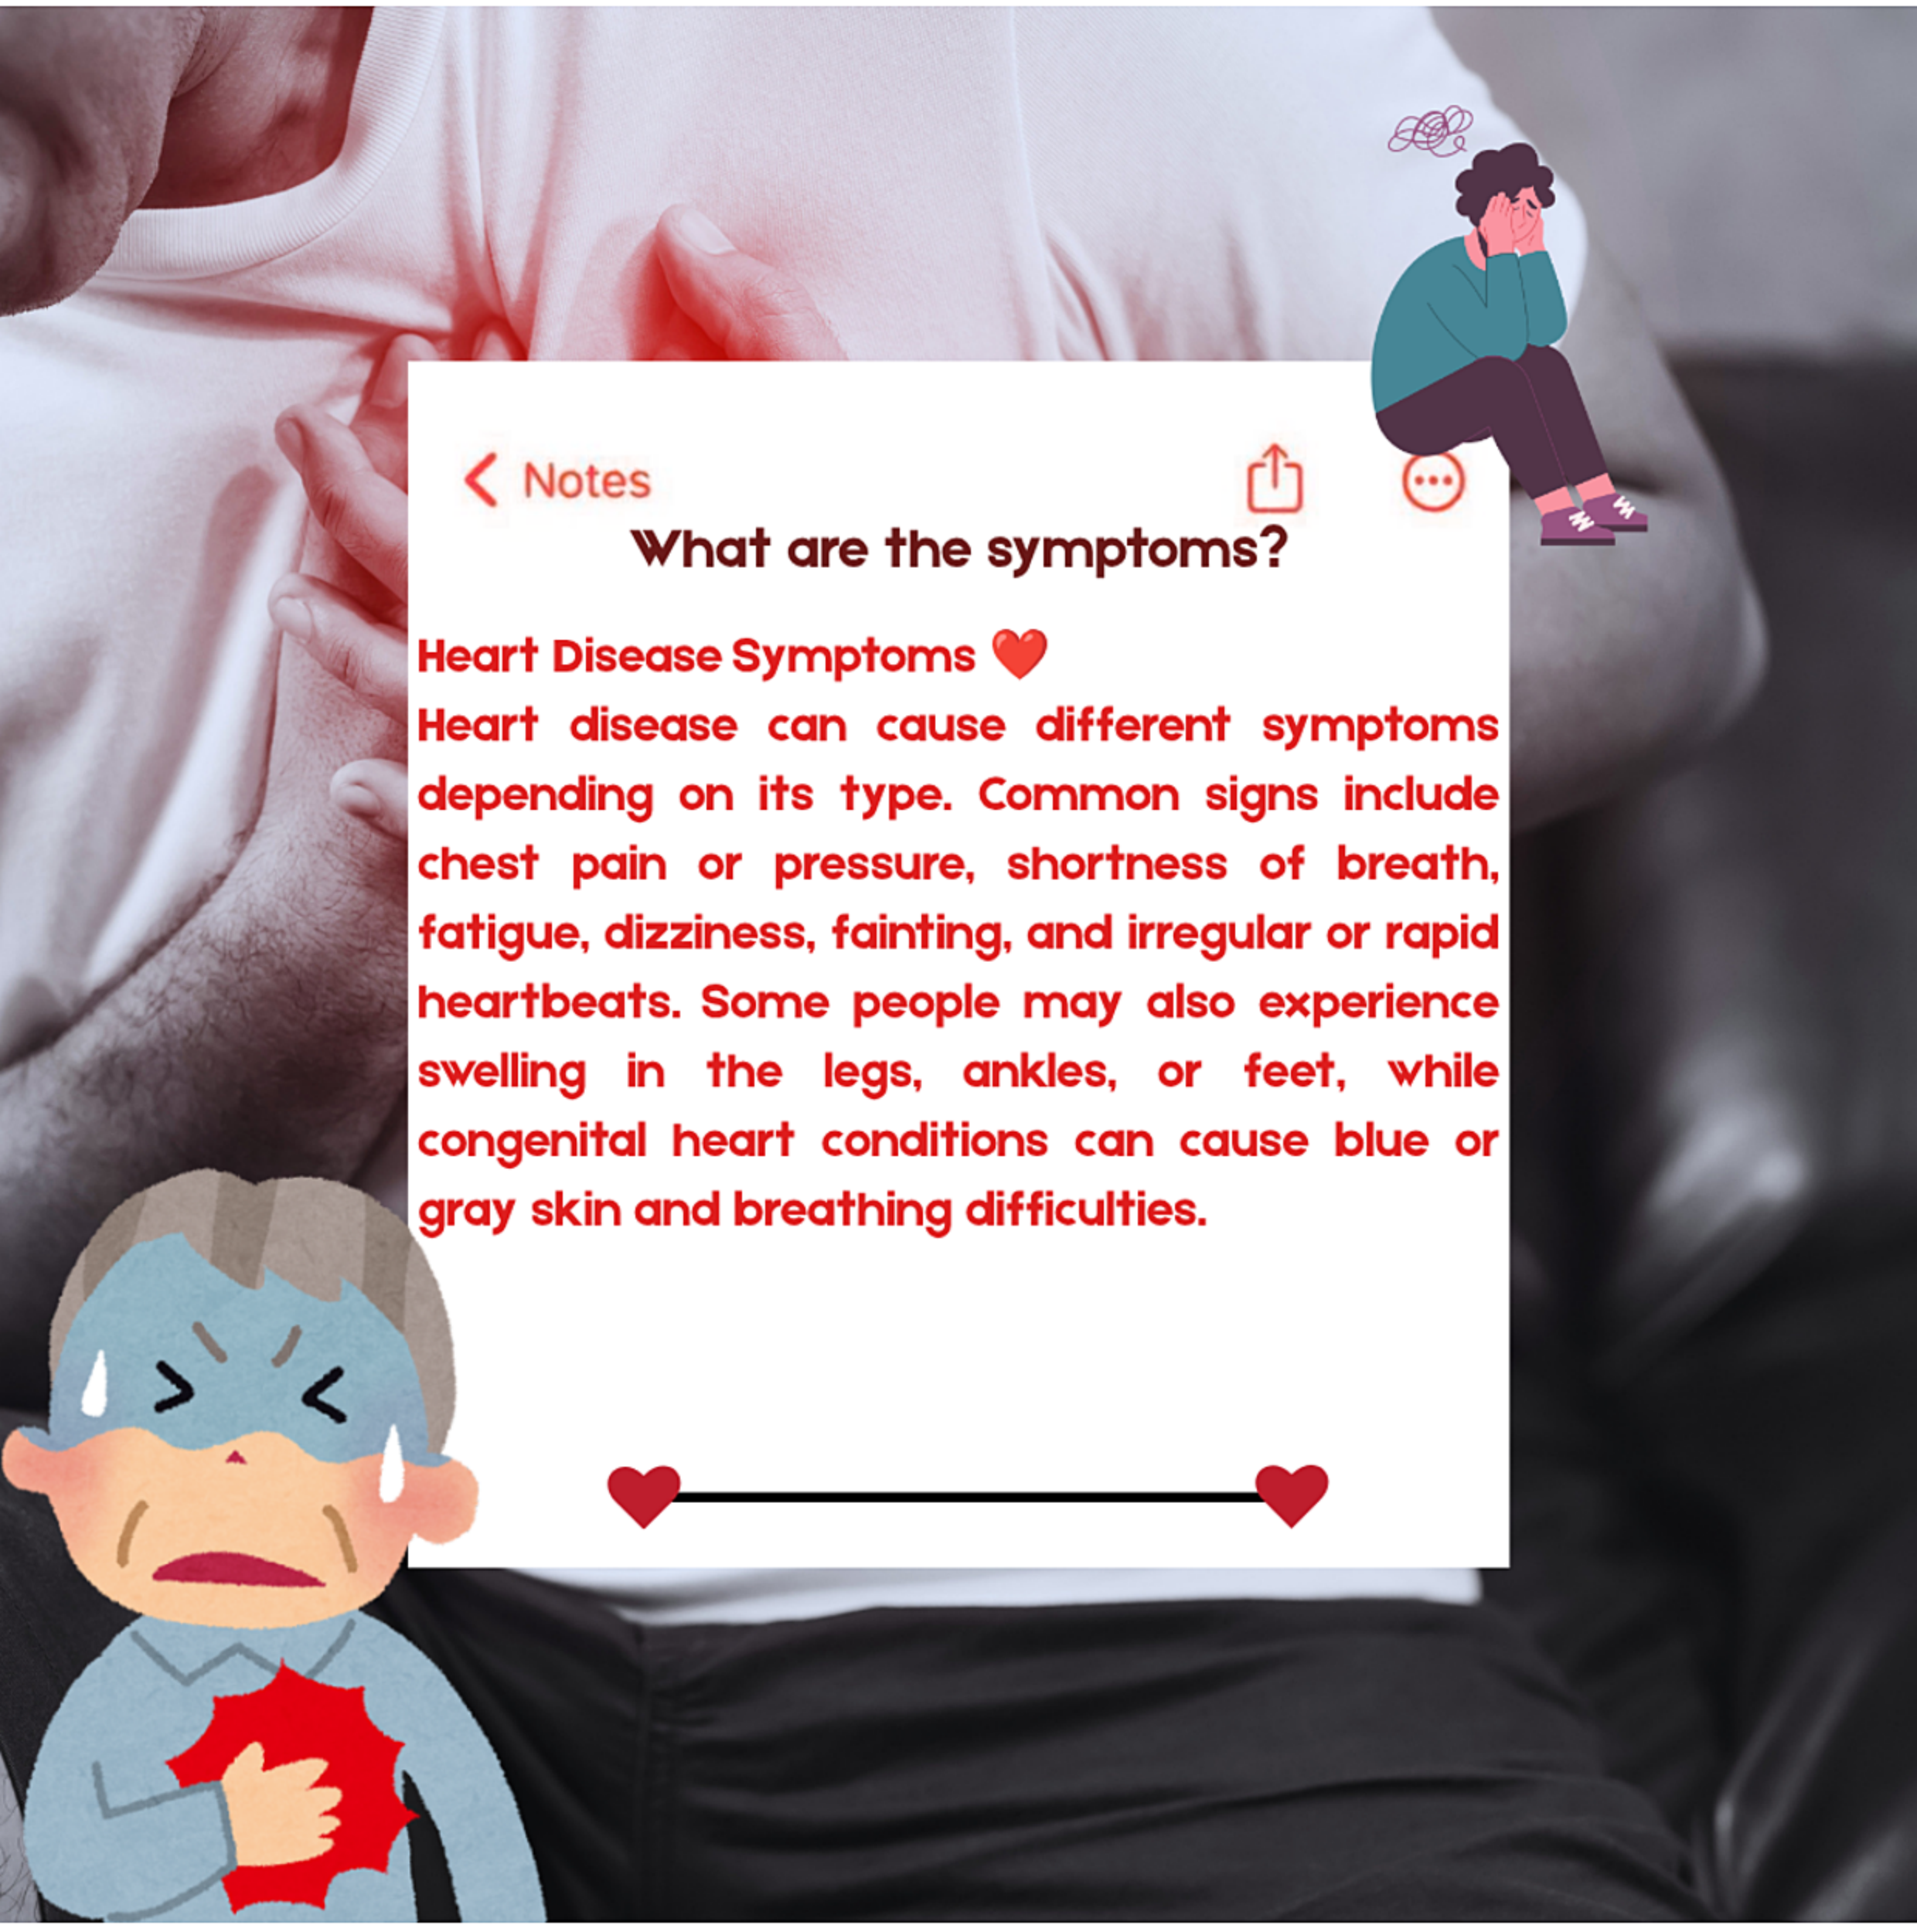

What is Heart Disease?

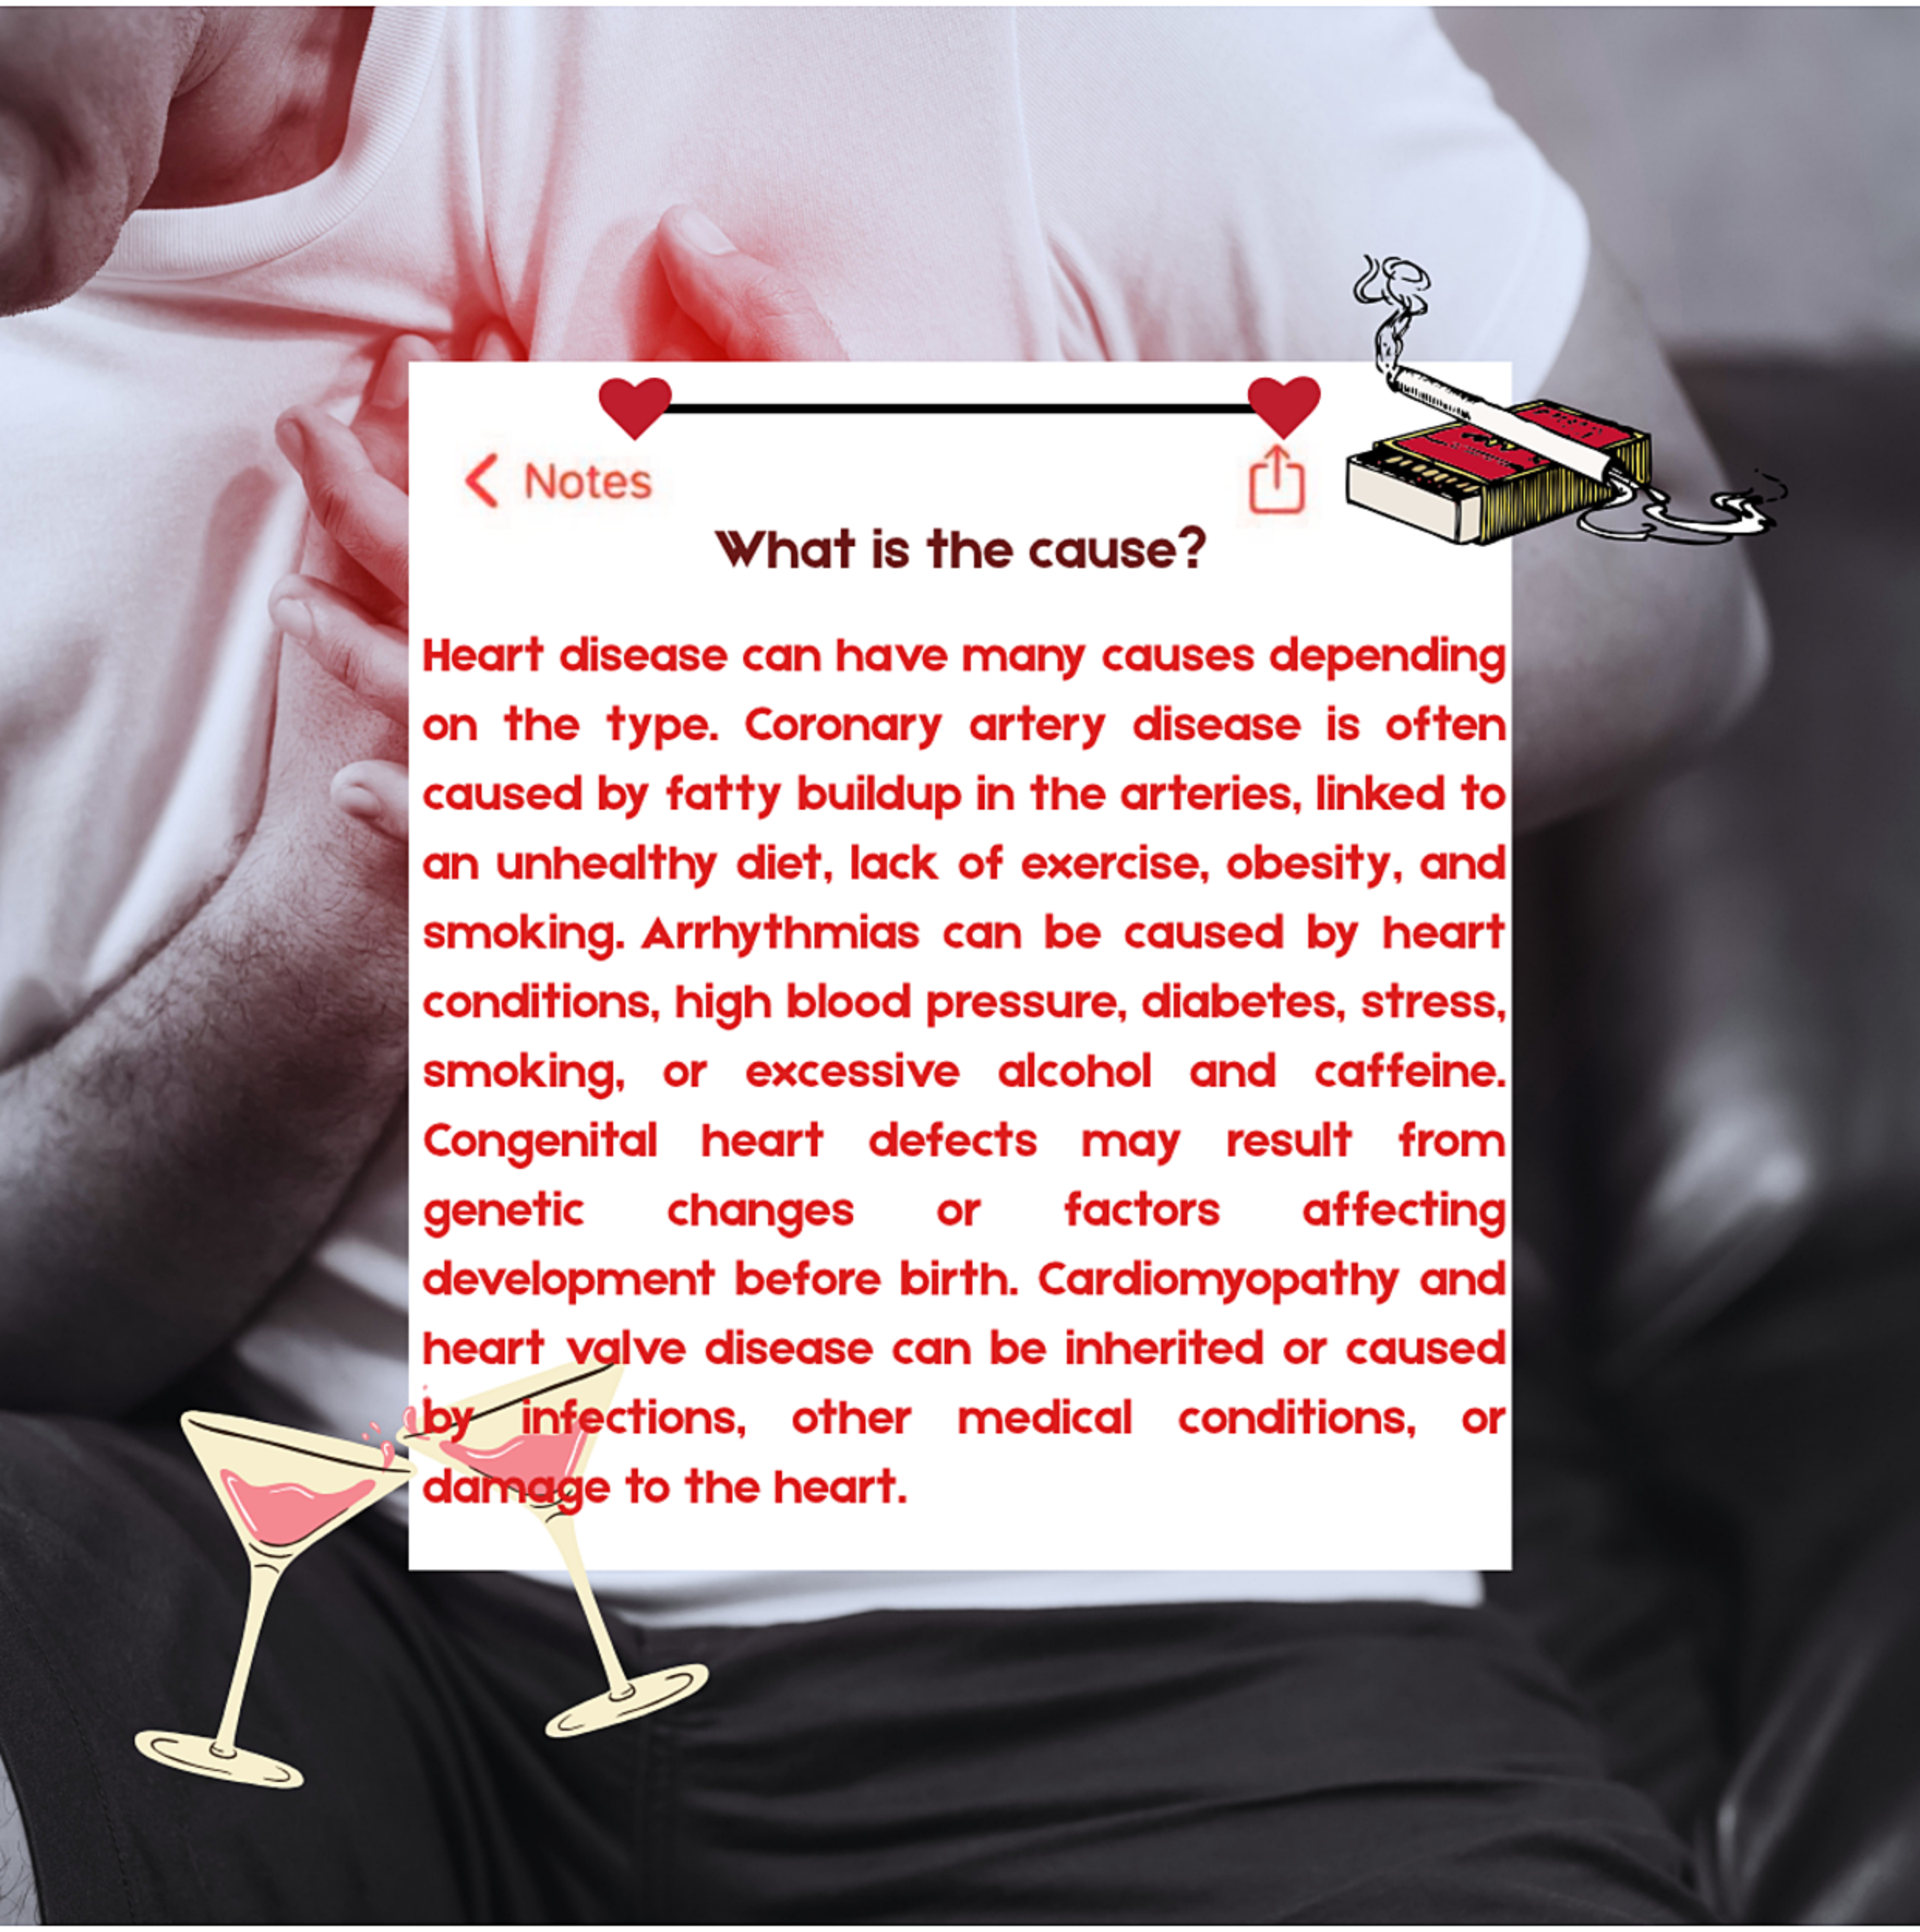

Heart disease describes a range of conditions that affect the heart. Heart disease includes:

- Blood vessel disease, such as coronary artery disease.
- Irregular heartbeats, called arrhythmias.
- Heart conditions that you're born with, called congenital heart defects.
- Disease of the heart muscle.
- Heart valve disease.

Many forms of heart disease can be prevented or treated with healthy lifestyle choices.

Notes
What are the symptoms?
Heart Disease Symptoms ❤️
Heart disease can cause different symptoms depending on its type. Common signs include chest pain or pressure, shortness of breath, fatigue, dizziness, fainting, and irregular or rapid heartbeats. Some people may also experience swelling in the legs, ankles, or feet, while congenital heart conditions can cause blue or gray skin and breathing difficulties.

Notes
What is the cause?
Heart disease can have many causes depending on the type. Coronary artery disease is often caused by fatty buildup in the arteries, linked to an unhealthy diet, lack of exercise, obesity, and smoking. Arrhythmias can be caused by heart conditions, high blood pressure, diabetes, stress, smoking, or excessive alcohol and caffeine. Congenital heart defects may result from genetic changes or factors affecting development before birth. Cardiomyopathy and heart valve disease can be inherited or caused by infections, other medical conditions, or damage to the heart.

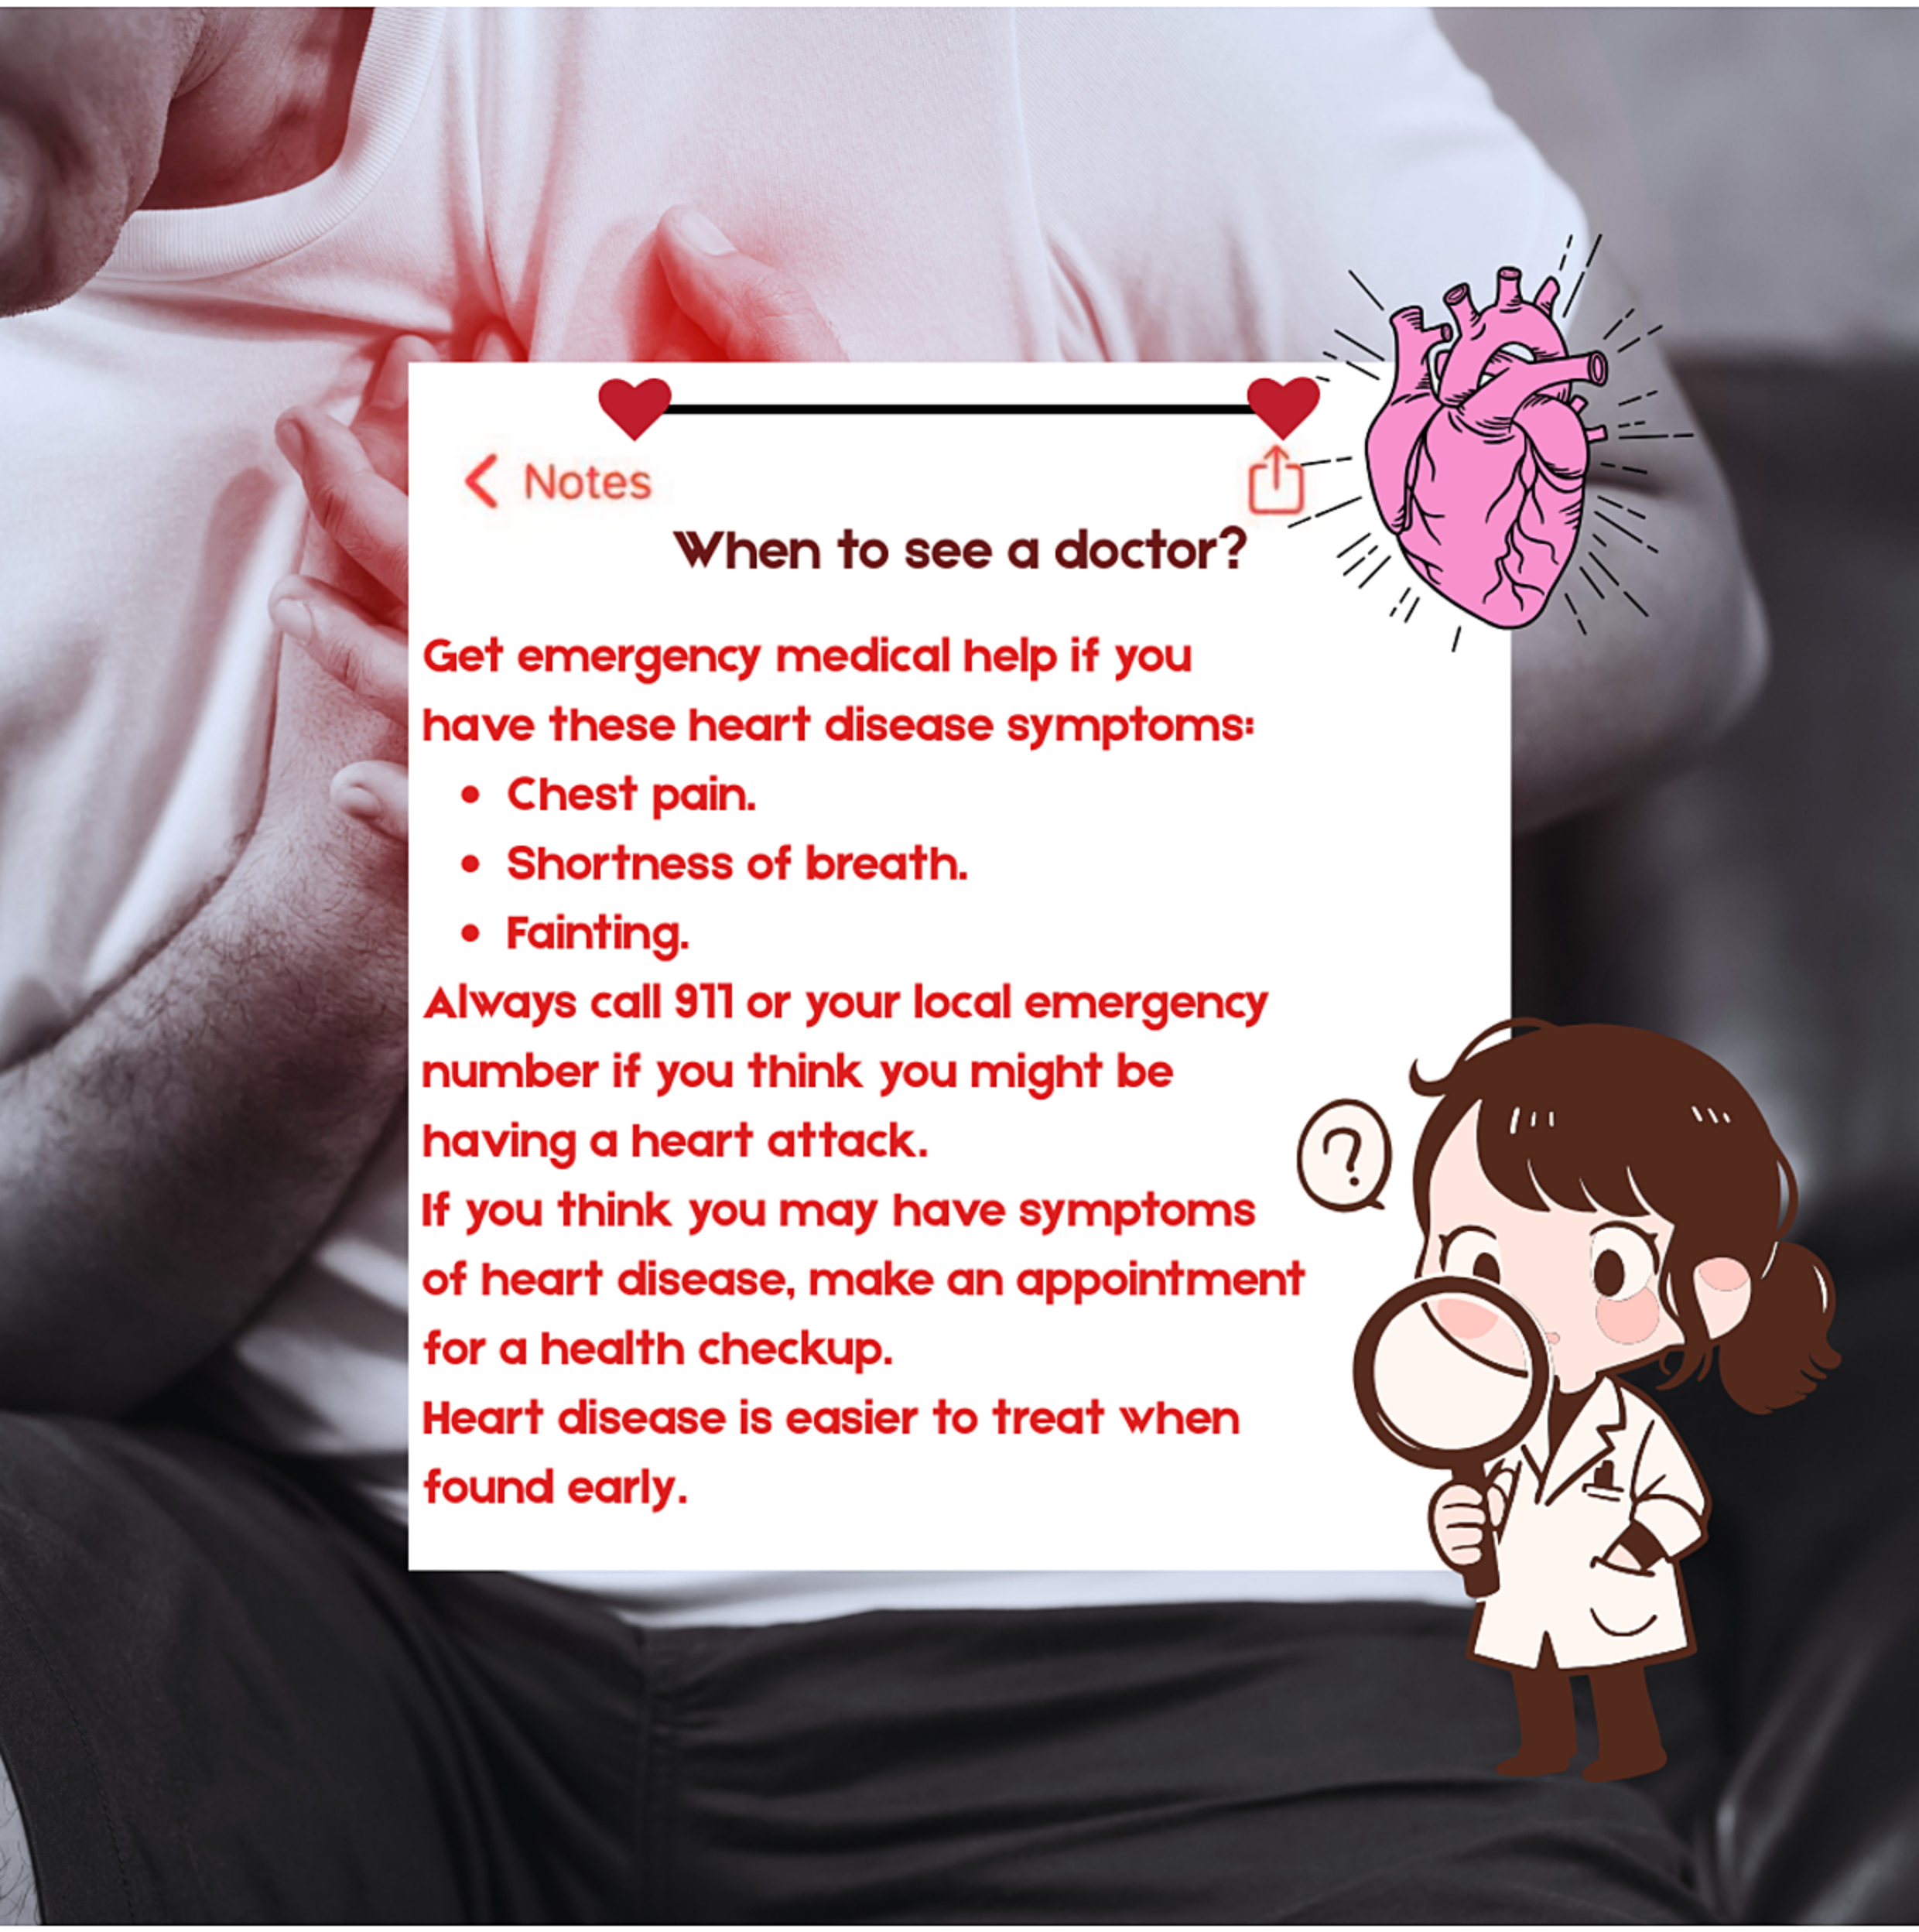

Notes
Risk Factors?
Several factors can increase the risk of heart disease, including age, family history, smoking, an unhealthy diet, high blood pressure, high cholesterol, diabetes, and obesity. Other factors include lack of physical activity, chronic stress, and poor dental health. Maintaining a healthy lifestyle and getting regular health checkups can help reduce your risk.

Notes

Possible Complications!

Heart disease can lead to serious complications, including heart failure, heart attacks, and strokes. It may also cause aneurysms, peripheral artery disease that reduces blood flow to the limbs, and sudden cardiac arrest, which causes the heart to suddenly stop functioning normally and requires immediate medical attention.

Notes
When to see a doctor?
Get emergency medical help if you have these heart disease symptoms:
• Chest pain.
• Shortness of breath.
• Fainting.
Always call 911 or your local emergency number if you think you might be having a heart attack.
If you think you may have symptoms of heart disease, make an appointment for a health checkup.
Heart disease is easier to treat when found early.

Notes

Prevention!!

The same lifestyle changes used to manage heart disease also may help prevent it. Try these heart-healthy tips:

- Don't smoke.
- Eat a diet that's low in salt and saturated fat.
- Exercise at least 30 minutes a day on most days of the week.
- Maintain a healthy weight.
- Reduce and manage stress.
- Control high blood pressure, high cholesterol and diabetes.
- Get good sleep. Adults should aim for 7 to 9 hours daily.

Good Night !
