

How you can perform a CPR

WHAT IS CPR?

CPR, or cardiopulmonary resuscitation, is an emergency life-saving procedure performed when a person's breathing or heartbeat has stopped

WHY IS CPR IMPORTANT

Keeping the blood flow active – even partially – extends the opportunity for a successful resuscitation once trained medical staff arrive on site.

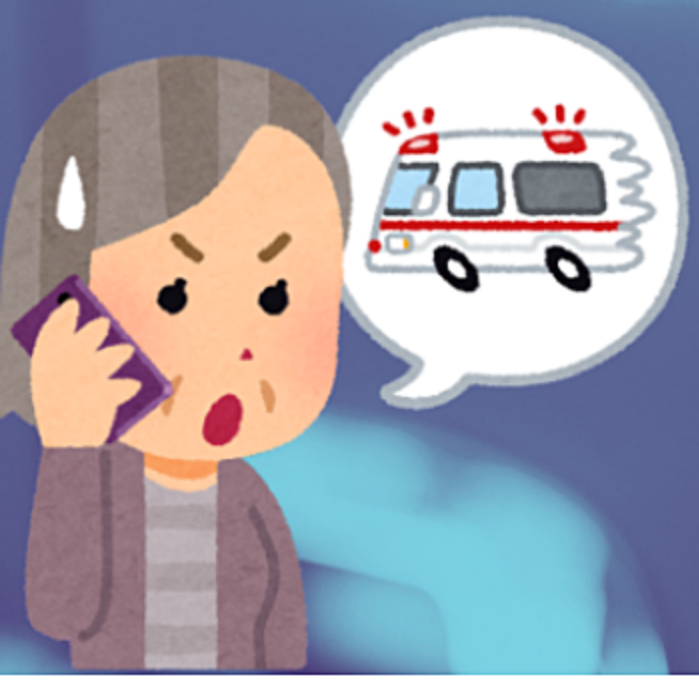

WHEN TO SEEK EMERGENCY HELP?

If you are not trained in CPR but can get to a phone right away, call 911 or your local emergency number first. Then start CPR. The dispatcher can tell you how to do CPR until help gets there. To learn CPR the right way, take a first aid course that is accredited. The course should teach you how to do CPR and how to use an automated external defibrillator (AED).

If you're afraid to do CPR or are not sure how to do CPR correctly, know that it's always better to try than to do nothing at all. The difference between doing something and doing nothing could be someone's life.
